This lecture is honestly one of the most emotionally impacting lectures to watch. I loved his optimism on life and his energy to do things! Even at the end, he was still driving on. It also reminded me of one of my childhood dreams: to design a video game. I've always thought about it since I knew what video games were. It was a nice reminder of that, especially at this time in my life where I am not sure what I really wanna do or where I wanna go. It would be amazing to make a video game, or video *games* really! I know that theres a lot of learning to do, but I know that I am more than capable of making something like that happen. Even if my dreams change, I know that I am capable of the new ones too.

I dont think that "learning styles" are a good reflection of how people perform best. Its like personality tests: it may catch the general things, but nothing super specific about you. Plus, as the Scientific American article pointed out, there isnt any scientific evidence that these are a thing that help people.
